

VASCULAR PLANT TYPE SPECIMENS IN THE NATIONAL
HERBARIUM (RAW), PAKISTAN AGRICULTURAL RESEARCH
COUNCIL, ISLAMABAD

YASIN J. NASIR* & RUBINA AKHTER*

ABSTRACT. A list is provided of the 126 type specimens located in the National Herbarium (RAW). The families best represented are Scrophulariaceae (29), Umbelliferae (24) and Papilionaceae (14).

Most of the plant collection (c.70,000 specimens) at the National Herbarium, formerly the Gordon College or Stewart Herbarium, grew as a result of the untiring efforts of its founder R. R. Stewart, who taught botany at Gordon College from 1911-1960. During this period, he travelled and collected plants widely in most parts of Pakistan and India, often assisted by his students and colleagues. Apart from the National Herbarium, there are three other important herbaria in Pakistan: at Karachi University (KUH), Quaid-e-Azam University, Islamabad (ISL), and at the Forest Institute, Peshawar (PPFI-B).

The 'Flora of Pakistan' project, a joint venture between the National Herbarium staff (Pakistan Agricultural Research Council, Islamabad) and the Botany Department (Karachi University), began in 1966. This scheme has given much impetus to botanical exploration and research, and, to date, accounts of 164 Angiospermic families have been published.

Critical appraisals and extensive researches have revealed many new species and novelties. Furthermore, many type specimens, hitherto overlooked or unnoticed, have been located in the National Herbarium. The list below is somewhat provisional in so far as further studies (especially on such large critical groups as the Compositae, Rosaceae, Scrophulariaceae, Cyperaceae etc.) are likely to reveal the presence of additional type materials.

The arrangement of families and the genera and species (basionyms) within them is alphabetical. Where applicable, the currently accepted name is given at the end of an entry.
